Ex No:10	**Interactive Dashboards**
Date:-08/04/26	**Video Link -** https://youtu.be/gCFlp-JiOxw

Aim

To design and develop interactive dashboards that effectively visualize data for better analysis and decision-making.

Tools

o Power BI/Tableau

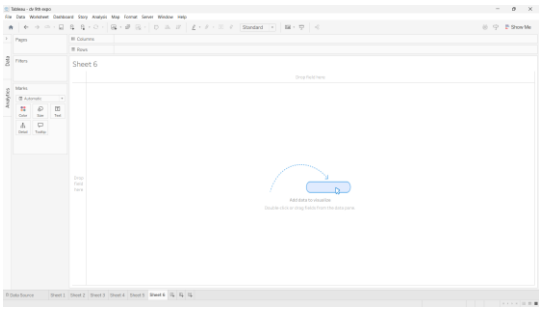
Description

This experiment focuses on building dashboards using visualization tools to present complex datasets in an easy-to-understand format. It includes data collection, cleaning, transformation, and visualization using charts, graphs, and filters. The dashboard enables users to explore insights dynamically and supports data-driven decisions across domains such as business, healthcare, and education.

Step 1:

- Open Tableau.
- Connect to the dataset.
- Tableau loads the dataset and displays the data fields.

Output:

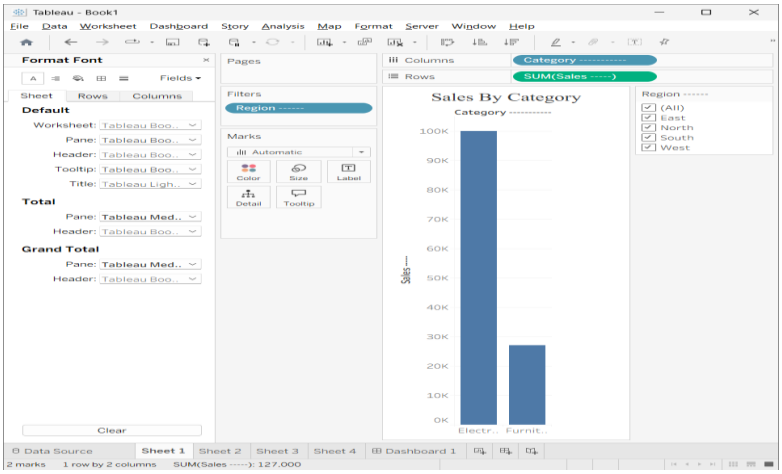


Step 2: Import the dataset and verify that all fields such as Product, Category, Region, Sales, and Profit are visible in the Data pane.

Step 3: Create Bar Chart

- Open Sheet 1.
- Drag Category → Columns.
- Drag Sales → Rows.
- Tableau automatically creates a Bar Chart.

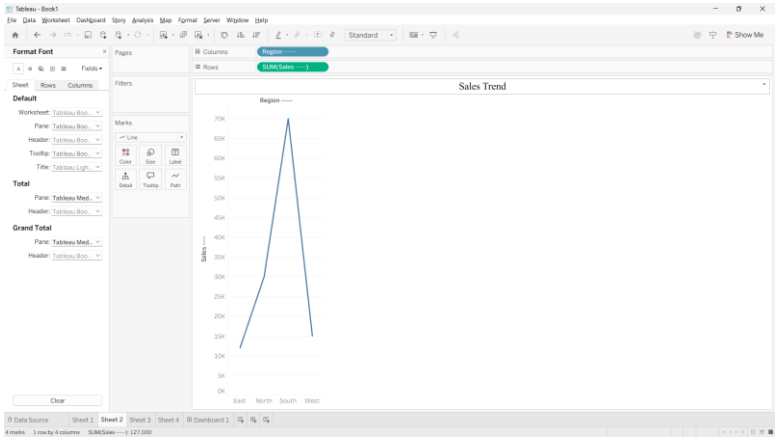
Output:



Step 4: Create Line Chart

- Open Sheet 2.
- Drag Order Date → Columns.
- Drag Sales → Rows.
- Select Line Chart from Show Me.

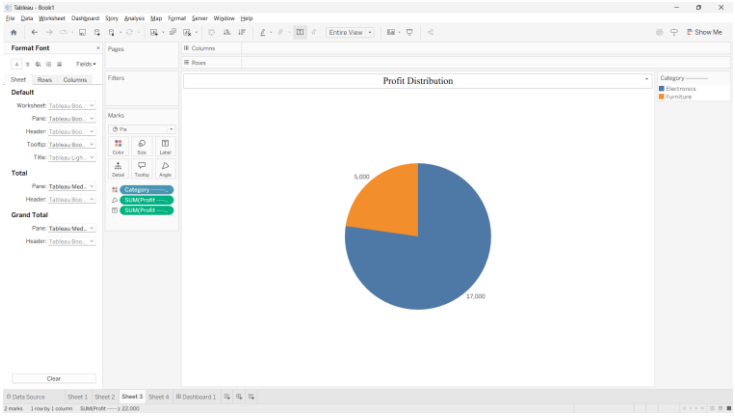
Output:



Step 5: **Create Pie Chart**

- Open Sheet 3.
- In Marks card, change Automatic → Pie.
- Drag Category → Color.
- Drag Sales → Angle.

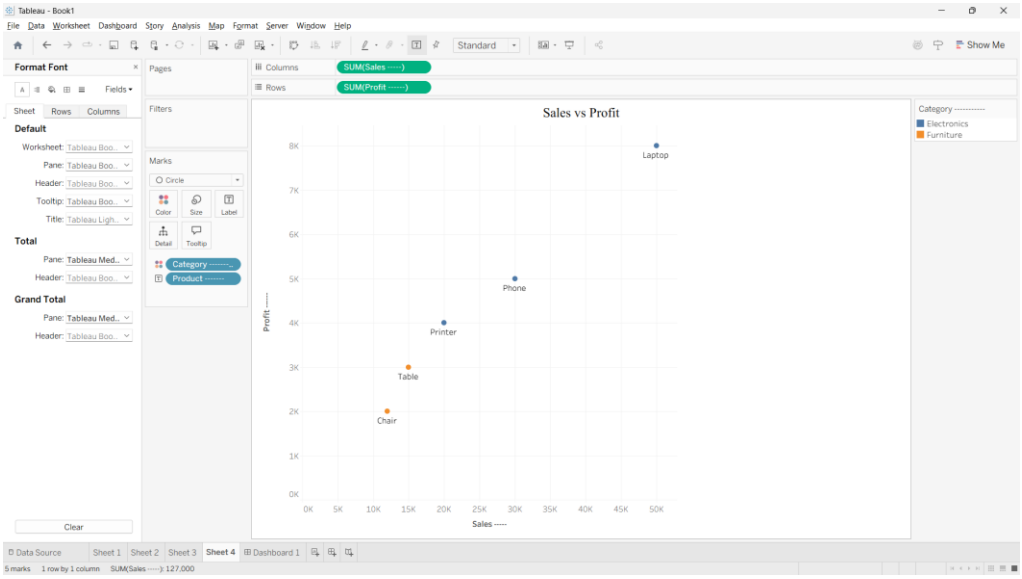
Output:



Step 6: Create Scatter Plot

- Open Sheet 5.
- Drag Sales → Columns.
- Drag Profit → Rows.
- Drag Category → Color.

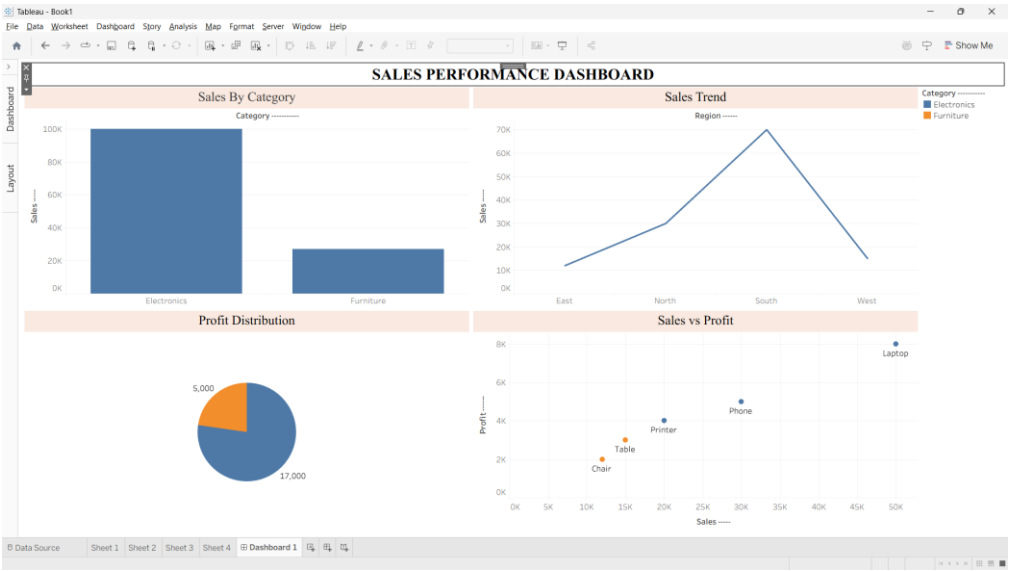
Output:



Step 7: Create Dashboard

- Click New Dashboard.
- Drag all created worksheets (Bar chart, Line chart, Pie chart, Scatter plot) into the dashboard.

Output:



Result: An interactive dashboard was successfully created using Tableau, displaying insights through bar charts, line charts, pie charts, and scatter plots. The dashboard allows users to explore the data dynamically using filters.
